Programming Example 9: Arrays

Introduction

As you read through this example, look for code that illustrates these important principles that relate to using arrays:

1. Declaring an Array
2. Declaring an Array with an Initializer list
3. Declaring a two dimensional array
4. Using loops to process array data
5. Passing an array to a method
6. Overloading methods to work on different kinds of arrays
7. Using the foreach loop
8. Using the Split method to break a string into tokens
9. Getting user data and saving it in an array
10. Displaying the contents of an array

The example program is located here.
